

GenXR Watch

THEMED PREVIEW 1 / PUBLICATION DATE TO BE DECIDED

Your idea, in three dimensions

AI asset tools give non-specialists a starting point for spatial prototypes. The next question is whether the result works in the experience you want to build.

AVAILABLE / TOOL SPOTLIGHT

From a reference to a 3D object

Meshy generates models from descriptions and images, with texturing and animation tools in the same service. What could you make without modelling every surface yourself? **Feature: page 2.**

Meshy website visual: an illustration of its image-to-3D offering. Company example, not an independently tested output.

AVAILABLE / WORKFLOW

A picture can guide the model

Meshy offers image-to-3D alongside text-to-3D. A visual reference gives the generator a target to follow. For an exhibit prop or teaching object, inspect hidden surfaces as carefully as the front.

[Meshy: first-model guide](#)

AVAILABLE / WORKFLOW

Give the surface a new look

Meshy offers AI texturing for generated or uploaded models. That may help explore alternative appearances. Material realism and historical accuracy still need judgement.

[Meshy: features](#)

AVAILABLE / WORKFLOW

Characters need a skeleton

Meshy includes automatic rigging and animation tools. These prepare characters for motion; they do not establish that every movement will suit your task or remain natural in a headset.

PROJECT DECISION

Export is the beginning of a test

Meshy supports common 3D export formats. Before producing a whole collection, try one object in the intended destination and check size, appearance, loading and interaction.

PRACTICAL FEATURE / CREATING 3D OBJECTS

Make the object. Then test its purpose.

Meshy offers an accessible route into asset creation. A useful prototype starts with a clear job for the object.

Meshy website visual: an illustration of its image-to-3D offering. Company example, not an independently tested output.

Why it matters. An educator may need a visual teaching prop; a curator may want to sketch an exhibition; a designer may want to compare product concepts. Meshy, an AI 3D-asset service, lets users begin with text or an image rather than manually modelling the entire object. Its official guide describes a browser workflow from input to generation and export. [1,2]

What you can do. The service combines model generation, surface texturing, rigging and animation. Its feature page lists common export formats including GLB, FBX and STL. The immediate opportunity is to create something concrete enough to inspect, revise and discuss. [1]

An illustrative project. Suppose a museum team needs a fictional object for an early exhibition mock-up. Prepare a reference, generate one candidate, and check its appearance from several angles. Compare alternatives with colleagues before deciding whether a specialist should refine the asset. This is a proposed workflow, not evidence of a tested museum installation.

Where it stops. A generated shape does not supply the story, learning activity or interaction around it. A handle may look usable while lacking the behaviour needed for a training exercise. Define what the user should do before choosing a production route.

What needs checking. For real artefacts, photographs and measurements remain the evidence. Treat unseen surfaces as uncertain unless you can verify them. In an XR prototype, test scale, readability and performance on the intended device. Inspection should follow the task, not just the beauty of the preview.

What will it cost?. Check the current plan for generation allowances, exports and client-use rights. Include time for revision and integration in the budget. A low subscription price does not establish the total cost of a finished experience.

The client opportunity. Start with one representative object and one intended use. Measure how much useful work the tool removes and how much cleanup remains. That gives a more defensible decision than generating an entire asset library first.
