THEMED PREVIEW 3 / PUBLICATION DATE TO BE DECIDED

A world people can use

Generating a setting, composing an experience and publishing it are different jobs. Understanding the handoffs helps you choose the right starting point.

AVAILABLE / TOOL SPOTLIGHT

Start with an experience template

VIVERSE offers a browser route for choosing and customising world templates. It belongs beside generative tools because it addresses composition and publishing. **Feature: page 2.**

AVAILABLE / GENERATION

Marble creates the setting

World Labs' Marble generates explorable environments from prompts or visual inputs. That can help with concept development. Check the interaction work still needed for a complete visitor or learner experience.

AVAILABLE / COMPOSITION

Templates offer a starting point

VIVERSE documents a browser workflow: choose a template, set world details and customise the space. This is accessible authoring; template use alone is not generative AI.

VIVERSE: template guide

AVAILABLE / PUBLISHING

Give the experience a destination

VIVERSE Studio accepts supported builds for publishing. A creator working with external tools must supply a working build, rather than assume that uploading project source will create a usable experience.

PROJECT DECISION

Check the whole visitor journey

For an exhibition or lesson, test entry, navigation, legibility and the intended task. Confirm the supported devices and access settings. The value is in what people can accomplish after they arrive.

Editorial: evaluation priorities

The space is ready. What happens inside it?

VIVERSE addresses authoring and distribution. Its role helps explain why a generated environment is only part of the project.

Why it matters. A client needs an experience that people can enter and use, not only an impressive rendering. VIVERSE, HTC's virtual-experience platform, offers authoring and publishing routes. Its template guide shows a browser workflow for choosing a world and setting its details. [1,2]

What you can do. Start with a template, name the world, set its visibility and customise it. VIVERSE also supports publishing content built with other tools through Studio. These routes serve different skill levels: a template project and a custom engine build should not be presented as equally simple. [2,3]

An illustrative project. A heritage educator might begin with a small exhibition space and a few approved objects. Arrange the content around one visitor question, then ask colleagues to try the route through it. This tests whether a spatial presentation is useful before investing in a larger experience. It is a proposed pilot, not an independently tested deployment.

Where generative AI fits. A service such as Marble can generate a setting; an asset generator can create objects. Composition tools arrange the experience, while publishing tools make it reachable. These functions may overlap, but compatibility between them must be checked rather than presumed.

Where it stops. A template does not establish that the content is educationally effective, accessible or suitable for every device. Test how users move, find information and complete the intended task. If the project needs collaboration or object manipulation, verify those behaviours directly.

What specialist support may add. Custom interactions, asset optimisation and deployment troubleshooting can exceed a simple template workflow. VIVERSE's publishing documentation requires suitable builds and distinguishes them from development source. That handoff is a practical project requirement. [3]

The client opportunity. Choose one complete user journey and make it work end to end. Measure access problems, task completion and revision effort. The strongest first pilot is small enough to test and substantial enough to reveal whether spatial presentation adds value.
